

**Effects of intensified oral P2Y<sub>12</sub> inhibition on  
elevated fibrin-platelet clot strength in patients  
with acute coronary syndromes  
(TEGCOR Study)**

## **Statistical Analysis Plan**

Comparison of clot strength measured by Thrombelastography in whole blood (TEG-MA) will be made with 2-sided Student's T-test after reloading of clopidogrel or prasugrel at 16-24 hours. Comparison of outcome events (death, recurrent myocardial infarction, recurrent unstable angina, repeat coronary intervention up to 6 months) will be made by Chi-Square test. All tests are performed two-sided with  $p < 0.05$  as significance threshold.
